Information Retrieval Basics: Agenda

- Information Retrieval History
- Information Retrieval & Data Retrieval
- Searching & Browsing
- Information Retrieval Models

Information Retrieval History

Currently there are no museums for IR

IR is the process of **searching** through a **document collection** based on a particular **information need**.

IR Key Concepts

- Searching
 - Indexing, Ranking

Textual, Visual, Auditive

- Particular Needs
 - Query, User based

A History of Libraries

Libraries are perfect examples for document collections.

- Wall paintings in caves
 - e.g. Altamira, ~ 18,500 years old
- Writing in clay, stone, bones
 - e.g. Mesopotamian cuneiforms, ~ 4.000 BC
 - e.g. Chinese tortoise-shell carvings, ~ 6.000 BC
 - e.g. Hieroglyphic inscriptions,
 Narmer Palette ~ 3.200 BC

A History of Libraries (ctd.)

Papyrus

- Specific plant (subtropical)
- Organized in rolls, e.g. in Alexandria

Parchment

- Independence from papyrus
- Sewed together in books

Paper

- Invented in China (bones and bamboo too heavy, silk too expensive)
- Invention spread -> in 1120 first paper mill in Europe

A History of Libraries (ctd.)

- Gutenberg's printing press (1454)
 - Inexpensive reproduction
 - e.g. "Gutenberg Bible"
- Organization & Storage
 - Dewey Decimal System (DDC, 1872)
 - Card Catalog (early 1900s)
 - Microfilm (1930s)
 - MARC (Machine Readable Cataloging, 1960s)
 - Digital computers (1940s+)

Library & Archives today

- Partially converted to electronic catalogues
 - From a certain time point on (1992 ...)
 - Often based on proprietary systems
 - Digitization happens slow
 - No full text search available
 - Problems with preservation
 - Storage devices & formats

History of Searching

- Browsing
 - Like "Finding information yourself"
- Catalogs
 - Organized in taxonomies, keywords, etc.
- Content Based Searching
 - SELECT * FROM books WHERE title='%Search%'
- Information Retrieval
 - Ranking, models, weighting
 - Link analysis, LSA, ...

History of IR

- Starts with development of computers
- Term "Information Retrieval" coined by Mooers in 1952
- Two main periods (Spark Jones u. Willett)
 - 1955 1975: Academic research
 - Models and Basics
 - Main Topics: Search & Indexing
 - 1975 ... : Commercial applications
 - Improvement of basic methods

A Challenge: The World Wide Web

- First actual implementation of Hypertext
 - Interconnected documents
 - Linked and referenced
- World Wide Web (1989, T. Berners-Lee)
 - Unidirectional links (target is not aware)
 - Links are not typed
 - Simple document format & communication protocol (HTML & HTTP)
 - Distributed and not controlled

Some IR History Milestones

- Book "Automatic Information Organization and Retrieval", Gerard Salton (1968)
 - Vector Space Model
- Paper "A statistical interpretation of term specificity and its application in retrieval", Karen Sparck Jones (1972)
 - IDF weighting
 - http://www.soi.city.ac.uk/~ser/idf.html
- Book "Information Retrieval" of C.J. Rijsbergen (1975)
 - Probabilistic Model
 - http://www.dcs.gla.ac.uk/Keith/Preface.html

Some IR History Milestones

- Paper "Indexing by Latent Semantic Analysis", S.
 Deerwester, Susan Dumais, G. W. Furnas, T. K.
 Landauer, R. Harshman (1990).
 - Latent Semantic Indexing
- Paper "Some simple effective approximations to the 2-Poisson model for probabilistic weighted retrieval" Robertsen & Walker (1994)
 - BM25 weighting scheme
- Paper "The Anatomy of a Large-Scale Hypertextual Web Search Engine", Sergey Brin & Larry Page (1998)
 - World Wide Web Retrieval

Information Retrieval Basics: Agenda

- Information Retrieval History
- Information Retrieval & Data Retrieval
- Searching & Browsing
- Information Retrieval Models

Organizational: References

- in the Library
 - Modern Information Retrieval, Ricardo Baeza-Yates & Berthier Ribeiro-Neto, Addison Wesley
 - Google's Pagerank and Beyond: The Science of Search Engine Rankings, Amy N. Langville & Carl D. Meyer, University Presses of CA
 - Distributed Multimedia Database Technologies supported by MPEG-7 and MPEG-21, Harald Kosch, CRC Press
 - Readings in Information Retrieval, Karen Sparck Jones,
 Peter Willett, Morgan Kaufmann

Organizational: References

WWW

- Skriptum Information Retrieval, Norbert Fuhr, Lecture Notes on Information Retrieval - Univ. Dortmund, 1996. Updated in 2002
- Information Retrieval 2nd Edt., C.J. Rijsbergen, Butterworth, London 1979

Through me:

 Lectures on Information Retrieval: Third European Summer-School, Essir 2000 Varenna, Italy, Revised Lectures, Maristella Agosti, Fabio Crestani & Gabriela Pasi (eds.), Lecture Notes in Computer Science, Springer 2000

Information Retrieval & Data Retrieval

Information Retrieval

- Information Level
- Search Engine
- Teoma / Google

Data Retrieval

- Data Level
- Data Base
- Oracle / MySQL

Information Retrieval & Data Retrieval

Information Retrieval	Data Retrieval
Content Based Search	Search for Patterns and String
Query ambigous	Query formal & unambigous
Results ranked by relevance	Results not ranked
Error tolerant	Not error tolerant
Multiple iterations	Clearly defined result set
Examples	Examples
Search for synonyms	Search for patterns
Bag of Words	SQL Statement

Retrieval is nearly always a combination of both.

Information Retrieval Basics: Agenda

- Information Retrieval History
- Information Retrieval & Data Retrieval
- Searching & Browsing

Information Retrieval Models

Information Retrieval Basics: Searching

A user has an information need, which needs to be satisfied.

- Two different approaches:
 - Browsing
 - Searching

Searching & Browsing

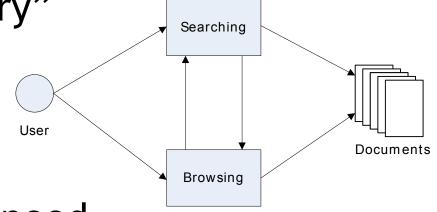

Searching

- Explicit information need
- Definition through "query"
- Result lists
- e.g. Google

Browsing

- Not necessarily explicit need
- Navigation through repositories

Browsing

Flat Browsing

- User navigates through set of documents
- No implied ordering, explicit ordering possible
- Examples: One single directory, one single file

Structure Guided Browsing

- An explicit structure is available for navigation
- Mostly hierarchical (file directories)
- Can be generic digraph (WWW)
- Examples: File systems, World Wide Web

Searching

- Query defines "Information Need"
- Ad Hoc Searching
 - Search when you need it
 - Query is created to fit the need
- Information Filtering
 - Make sets of documents smaller
 - Query is filter criterion
- Information Push
 - Same as filtering, delivery is different

Information Retrieval Basics: Agenda

- Information Retrieval History
- Information Retrieval & Data Retrieval
- Searching & Browsing

Information Retrieval Models

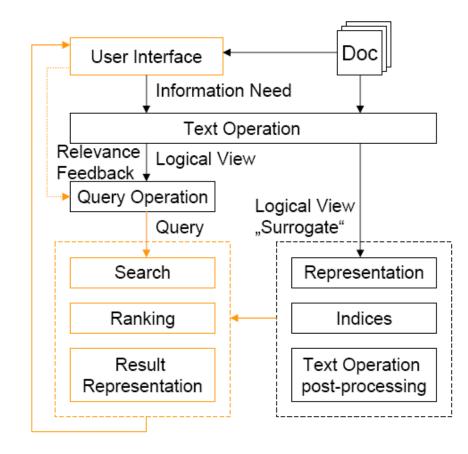

Information Retrieval System Architecture

Aspects

- Query & languages
- IR models
- Documents
- Internal representation
- Pre- and post-processing
- Relevance feedback
- HCI

Information Retrieval Models

- Boolean Model
 - Set theory & Boolean algebra
- Vector Model
 - Non binary weights on dimensions
 - Partial match
- Probabilistic Model
 - Modeling IR in a probabilistic framework

Formal Definition of Models

An information retrieval model is a quadruple $[D, Q, F, R(q_i, d_j)]$

- D is a set of logical views (or representations) for the **documents** in the collection.
- Q is a set of logical views (or representations) for the user needs or queries.
- F is a framework for modeling document representations, queries and their relationship.
- $R(q_i, d_j)$ is a **ranking function** which associates a real number with a query q_i of Q and a document d_j of D.

Definitions

in Context of Text Retrieval

- index term word of a document expressing (part of) document semantics
- weight $w_{i,j}$ quantifies the importance of index term t_i for document d_j
- index term vector for document d_j (having t different terms in all documents):

$$\overrightarrow{d}_{j} = (w_{1,j}, w_{2,j}, ..., w_{t,j})$$

Boolean Model

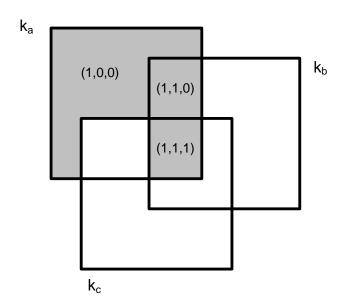

- Based on set theory and Boolean algebra
 - Set of index terms
 - Query is Boolean expression
- Intuitive concept:
 - Wide usage in bibliographic system
 - Easy implementation and simple formalisms
- Drawbacks:
 - Binary decision components (true/false)
 - No relevance scale (relevant or not)

Boolean Model: Example

$$q = k_a \wedge (k_b \vee \neg k_c)$$

Boolean Model: DNF

$$q = k_a \land (k_b \lor \neg k_c) \dots \overrightarrow{q}_{dnf} = (1,1,1) \lor (1,1,0) \lor (1,0,0)$$

- Express queries in disjunctive normal form (disjunction of conjunctive components)
- Each of the components is a binary weighted vector associated with (k_a, k_b, k_c)
- Weights $w_{i,j} \in \{0,1\}$

Boolean Model: Ranking function

$$sim(d_{j},q) = \begin{cases} 1 & \text{if } \exists \vec{q}_{cc} \middle| (\vec{q}_{cc} \in \vec{q}_{dnf}) \land (\forall_{k_{i}}, g_{i}(\vec{d}_{j}) = g_{i}(\vec{q}_{cc})) \\ 0 & \text{otherwise} \end{cases}$$

 similarity is one if one of the conjunctive components in the query is exactly the same as the document term vector.

Boolean Model

Advantages

- Clean formalisms
- Simplicity

Disadvantages

- Might lead to too few / many results
- No notion of partial match
- Sequential ordering of terms not taken into account.

Thanks ...

for your attention!
